

CHAPTER : 2

Introduction

The entities required for the Vilvah system are identified based on the business requirements of the organization. The attributes of each entity, along with their primary keys, foreign keys, and data types, are defined to ensure proper data organization and efficient data management. The relationships between the entities are identified to represent the interactions within the system, including customer management, product management, supplier management, inventory management, order processing, and payment management. In addition, the cardinality of each relationship is determined to define how the entities are associated with one another. This analysis provides a clear understanding of the database requirements and establishes a strong foundation for designing an efficient relational database while ensuring data integrity, consistency, and minimal redundancy.
